Recombinant secreted proteins can be produced by transforming host cells and culturing them under suitable conditions. The polynucleotide and protein are predicted to have biological conditions which would make them suitable for treating, preventing or ambiliotrating medical conditions in humans and animals. Some predicted biblogical activities include cytokine and cell proliferation/
conditions and conditions in humans and cell proliferation/
conditions include cytokine and cell proliferation/
conditions activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activiny, inhibin activity, chemotactic/chemokinetic activity, activity, activity, cadherin/tumour invasion suppressor activity, and the tumour inhibition activity. The polynucleotide encoding secreted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8888888×8
         The amino acid sequence codes for a protein capable of functioning sa a UDP- Gal:[beta-D-Gal(1.4)]-D-GlCNAC alpha (1.3)galacto-syltransferase. The products of this enzyme, sub-terminal alpha (1.3) and alpha(1.4) fucose residues are used in the post-translational modification of the oligosaccharides on cell-surface, intracellular or secreted proteins or lipids. These can be used for the prodn. of diagnostics and therapeutics. There is a single transmembrane domain consisting of a 19 amino acid hydrophobic segment flanked by basic residues and a large (presumably catalytic) C-terminal domain that would ultimately be targeted to the lumen of the Golgi. It has two potential N-glycosylation sites indicating that as with other glycosyltransferases, it may be synthesised as a glycoprotein. It is representative of a Type II transmembrane protein. See also R13749-R13752.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               glycoprotein. The alpha-galactosyl epitope enhances phagocytosis and subsequent processing of the antigen. The method is useful in the treatment of tumours e.g. leukemia, lymphoma, myeloma, melanoma, carcinoma and sarcoma, or for the generation of viral vaccines by opsonising a viral glycoprotein. The alpha-galactosyl epitope enhances recognition of the antigen in an animal that synthesises the naturally

Murine UDP-Gal:beta-D-Gal(1,4)-D-GlcNAc alpha(1,3)-galactosyltransferase (W1639) catalyses the a transglycosylation reaction between UDP-Gal and N-acetyllactosamine and is associated with surface-localised expression of Gal(alphal-3)Gal linkages. Its amino acid sequence was deduced from a cDNA clone (T61676) obtd. by transfecting COS-1 cells with cDNA derived from mouse F9 teratocarcinoma cells, and screening the transfected cells for surface-localised Gal(alphal-3)Gal linkages. When expressed in animal cell lines, the enzyme provides specific capabilities with respect to post-translational modification of the oligosaccharides of expressed proteins or lipids. The enzyme can also be used to raise antibodies and to screen for inhibitor cpds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell surface oligosaccharide structures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant fucosyltransferase proteins -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC typylori infection or to identify H. pylori polypeptide binding CC compounds, useful as potential H. pylori polypeptide activators or CC inhibitors. The genomic sequence of H. pylori (ATCC 55679) was CC determined from overlapping contigs generated by mechanically CC shearing the bacterial DNA. The sequences were analysed for ORF of CC determined the nucleotides, and the predicted coding regions defined CC decimal contiguences were analysed for ORF of CC vaccine development, the amino acid sequences predicted from CC vaccine development, the amino acid sequences predicted from CC vaccine development, the amino acid sequences predicted from CC vaccine development, the amino acid sequences predicted from CC vaccine development, and the production determined CC the sequences of interest, particular regions can be isolated from CC H. pylori by PCR amplification for recombinant polypeptide CC vaccines of interest, particular regions can be isolated from CC H. pylori by PCR amplification for recombinant polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Best Local Similarity

The enzyme catalyses the attachment of a galactose sugar molecule on the N-acetyllactosamine molety found on surface glycoproteins and glycolipids. These sugar molecules are partly responsible for raising anti-graft antibodies, which lead to graft tissue rejection. The invention relates to a method of inhibiting the graft rejection mechanism by introducing the sequence encoding an antibody targeted to alpha-1.3-GT into the cells of animal,
                                    Transgenic non-human donors of organs for human recipients containing DNA encoding antibodies that inhibit graft rejection % \left( 1\right) =\left\{ 1\right\}

                                                                                                                                                                                                                                                                             Sus scrofa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                especially a pig, from whom organs may be used for xenotransplants. Neutralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing induction of the rejection response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents isoform 3 of the porcine enzyme alpha-1,3-galactosyl transferase (alpha-1,3-GT). The enzyme catalyses the attachment of a galactose sugar molecule on the N-acetyllactosamine molecty found on surface glycoproteins and glycolipids. These sugar molecules are partly responsible for raising anti-graft antibodies, which lead to graft tissue rejection. The results relates to a method of inhibiting the graft rejection mechanism by introducing the sequence encoding an antibody targeted to alpha-1,3-GT into the cells of animal, especially a pig, from whom organs may be used for xenotransplants. Neutralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing induction of the rejection response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gal-alpha (1,3) galactosyl transferase; xenograft; transplant;

                                                                                                                                                                                                                             Pig alpha(1,3)-galactosyltransferase (R90573) was expressed in monkey COS cells following transfection of the cells with vector pGT which contains an insert including the encoding CDNA (T12242). Co-transfection of these cells with vector pHT encoding human H-transferase (R90572) resulted in a reduction in the levels of galactose alpha(1,3) galactose epitopes expressed

The enzyme catalyses the attachment of a galactose sugar molecule on the N-acetyllactosamine molecule from the necessary of the surface glycoproteins and glycolipids. These sugar molecules are partly responsible for raising anti-graft antibodies, which the did to graft tissue rejection. The invention relates to a method of impubiling the graft rejection mechanism by introducing the sequence engoding an antibody targeted to alpha-1,3-GT into the cells of animal, especially a pig, from whom organs may be used for xenotransplants. Newtralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing induction of the rejection response.

It is then inserted into a porcine occyte (from which the pronuclear material has been removed), which is itself grown to produce the transgenic swine. Swine which do not express AGT will not produce carbohydrate moieties conty, the distinctive terminal Gal-alpha-1,3-Gal-beta-1-4GlcNAc epitope, which is a significant factor in xenogenic (sep. human) transplant rejection of swine grafts. Therefore the swine cells produced in the AGT negative transgenic swine are xenogenic transplant rejection resistant, and can therefore be used by a transplant

DNA and nucleic acid constructs for inactivating the transferase gene; for eliminating hyperacute region in human transplants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cDNA encoding porcine alpha-1,3-GalT was generated from liver RNA using primers based on conserved regions of the mouse and cattle alpha-1,3-GalT genes. Potential sites to interrupt the alpha-1,3-GalT gene (via homologous recombination) were identified in exons 4, 7, 8 and 9. Such inactivation allows the breeding of 'knock-out' animals, e.g. pigs suitable as donors of organs to overcome hyperacute rejection
This sequence represents isoform 1 of the porcine enzyme alpha-1,3-galactosyl transferase (alpha-1,3-GT). The enzyme catalyses the attachment of a galactose sugar molecule on the N-acetyllactosamine
                                                                                                                                                                                                                                                                                                                                                                                                                   Isoform; porcine; enzyme; alpha-1,3-galactosyl transferase; galactose;

                                                                                            The present sequence represents a Salmonella typhimurium peptide sequence. The Salmonella nucleotide (X83935), its complement (X83936) and fragments (X83937 to X83971), are useful for detecting and diagnosing Salmonella infection in humans, animals and food. The nucleotides will detect many, if not all Salmonella species especially Salmonella dublin, S. enteritidis, S. gallinarum, S. minnesota, S. paratyphi (types A, B and C), S. pullorum, S. typh ty21a and S. typhimurium. The fragments may be used to construct a DNA chip, useful for the simple and inexpensive testing of substances for the presence of Salmonella.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     molecty found on surface glycoproteins and glycolipids. These sugar molecules are partly responsible for raising anti-graft antibodies, wh lead to graft tissue rejection. The invention relates to a method of inhibiting the graft rejection mechanism by introducing the sequence encoding an antibody targeted to alpha-1,3-GT into the cells of animal especially a pig, from whom organs may be used for xenotransplants. Neutralisation of the alpha-1,3-GT leads to tissues or organs lacking the galactose on the glycoproteins and glycolipids, thus preventing induction of the rejection response.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   seq

:
Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score

phose number: A93209; MUID:79199779
ephts: annotation; X-ray crystallography, 2.5 angstroms; muscle
pent: The structure consists of two discrete, globular domains that are joined by
the form a helix associated with the amino-terminal domain.

synGAP-b1 protein - rat
C;Species: Rattus norvegicus (Norway rat)
C;Date: 20-Sep-1999 #sequence_revision 20-Sep-1999 #text_change 20-Sep-1999
C;Accession: T13958

submitted to the EMBL Data A; Description: SynGAP-bl.

Library,

August 1998

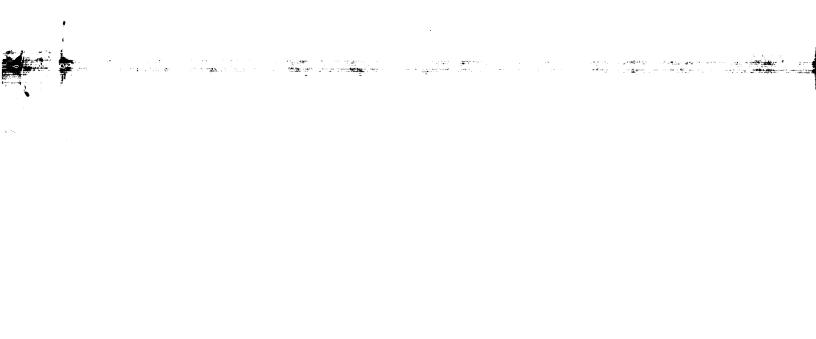

R; Suzuki,

T13958
